All maximal tori of  $\overline{G}$  are conjugate in  $\overline{G}$ .

 $\overline{G}$  is reductive if its unipotent radical  $R_u(\overline{G})$  is trivial.

 $\overline{G}$  is simple if  $\overline{G}$  has no proper closed connected normal subgroups (any normal subgroup must be finite and must lie in the centre)

Let  $D_n(k)$  be the subgroup of all diagonal matrices of  $GL_n(k)$ . An algebraic group isomorphic to  $D_n(k) (\cong k^* \times \ldots \times k^*)$  is a **torus**.

All maximal tori of  $\overline{G}$  are conjugate in  $\overline{G}$ .

 $\overline{G}$  is reductive if its unipotent radical  $R_u(\overline{G})$  is trivial.

 $\overline{G}$  is simple if  $\overline{G}$  has no proper closed connected normal subgroups (any normal subgroup must be finite and must lie in the centre)

Let  $\overline{T}$  be a max. torus. Let  $\overline{B}$  be a Borel subgroup of  $\overline{G}$ . If G is reductive connected, then there is the unique Borel subgroup  $\overline{B}^-$  such that  $\overline{B} \cap \overline{B}^- = \overline{T}$ .

Let  $D_n(k)$  be the subgroup of all diagonal matrices of  $GL_n(k)$ . An algebraic group isomorphic to  $D_n(k) (\cong k^* \times \ldots \times k^*)$  is a **torus**.

All maximal tori of  $\overline{G}$  are conjugate in  $\overline{G}$ .

 $\overline{G}$  is reductive if its unipotent radical  $R_u(\overline{G})$  is trivial.

 $\overline{G}$  is simple if  $\overline{G}$  has no proper closed connected normal subgroups (any normal subgroup must be finite and must lie in the centre)

Let  $\overline{T}$  be a max. torus. Let  $\overline{B}$  be a Borel subgroup of  $\overline{G}$ . If G is reductive connected, then there is the unique Borel subgroup  $\overline{B}^-$  such that  $\overline{B} \cap \overline{B}^- = \overline{T}$ .

#### Example

 $\overline{G} = SL_n(k)$  is simple,  $\overline{T} = D_n(k) \cap \overline{G}$  is max. torus,  $\overline{B}$  is the subgroup of upper triangular matrices,  $\overline{B}^-$  – lower triangular matrices.

Let C be minimal proper subgroup of  $R_u(\overline{B})$  or  $R_u(\overline{B}^-)$ , normalized by  $\overline{T}$ .

Let *C* be minimal proper subgroup of  $R_u(\overline{B})$  or  $R_u(\overline{B}^-)$ , normalized by  $\overline{T}$ . *C* is isomorphic to  $k^+$ .

Э

< ロ > < 同 > < 三 > < 三 > < 三 > <

Let *C* be minimal proper subgroup of  $R_u(\overline{B})$  or  $R_u(\overline{B}^-)$ , normalized by  $\overline{T}$ . *C* is isomorphic to  $k^+$ .

There is a homomorphism  $\overline{T} \to \operatorname{Aut}(k^+) \cong k^*$ .

- Let *C* be minimal proper subgroup of  $R_u(\overline{B})$  or  $R_u(\overline{B}^-)$ , normalized by  $\overline{T}$ . *C* is isomorphic to  $k^+$ .
- There is a homomorphism  $\overline{T} \to \operatorname{Aut}(k^+) \cong k^*$ .

Hence C determines an element of  $\operatorname{Hom}(\overline{T}, k^*) = X$ .

- Let *C* be minimal proper subgroup of  $R_u(\overline{B})$  or  $R_u(\overline{B}^-)$ , normalized by  $\overline{T}$ . *C* is isomorphic to  $k^+$ .
- There is a homomorphism  $\overline{T} \to \operatorname{Aut}(k^+) \cong k^*$ .

Hence *C* determines an element of  $\operatorname{Hom}(\overline{T}, k^*) = X$ . Such elements of *X* are  $\overline{T}$ -roots of  $\overline{G}$ .

Roots form a finite subset  $\Phi$  of X (independent of the choice of  $\overline{B}$  containing  $\overline{T}$ .)

The subgroup giving rise to  $\alpha \in X$  is a root subgroup  $X_{\alpha}$ .

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○○○

The subgroup giving rise to  $\alpha \in X$  is a root subgroup  $X_{\alpha}$ .

## Example

$$\overline{\mathbf{G}} = SL_{l+1}(k), \ \overline{\mathbf{T}} = D_{l+1}(k) \cap \overline{\mathbf{G}}; \Phi = A_l = \{ \pm (a_i - a_j) | 1 \leq i < j \leq l+1 \}; \ X_{a_i - a_j} = \{ E + te_{ij}; t \in k \}$$

< ロト < 同ト < 三ト < 三ト

Let char(k) = p > 0 and  $q = p^e$ .

<ロト < 団 > < 豆 > < 豆 > < 豆 > < 豆 > < < つ < ○</p>

Anton Baykalov (UoA)

Let 
$$char(k) = p > 0$$
 and  $q = p^{e}$ .  
Let  $\phi_q : (a_{ij}) \mapsto (a_{ij}^{q})$ .

Let char(k) = p > 0 and  $q = p^{e}$ . Let  $\phi_q : (a_{ij}) \mapsto (a_{ii}^{q})$ .

Homomorphism  $\sigma : \overline{G} \to \overline{G}$  is a standard Frobenius map if there exists injective hom.  $i : \overline{G} \to GL_n(k)$  for some n s.t.

 $i(\sigma(g)) = \phi_q(i(g))$  for all  $g \in \overline{G}$ .

Let char(k) = p > 0 and  $q = p^e$ . Let  $\phi_q : (a_{ij}) \mapsto (a_{ij}^q)$ .

Homomorphism  $\sigma : \overline{G} \to \overline{G}$  is a standard Frobenius map if there exists injective hom.  $i : \overline{G} \to GL_n(k)$  for some *n* s.t.

$$i(\sigma(g)) = \phi_q(i(g))$$
 for all  $g \in \overline{G}$ .

A hom.  $\sigma$  is a **Frobenius map** if some power of  $\sigma$  is a standard Frobenius map.

Let char(k) = p > 0 and  $q = p^e$ . Let  $\phi_q : (a_{ij}) \mapsto (a_{ij}^q)$ .

Homomorphism  $\sigma : \overline{G} \to \overline{G}$  is a standard Frobenius map if there exists injective hom.  $i : \overline{G} \to GL_n(k)$  for some *n* s.t.

$$i(\sigma(g)) = \phi_q(i(g))$$
 for all  $g \in \overline{G}$ .

A hom.  $\sigma$  is a **Frobenius map** if some power of  $\sigma$  is a standard Frobenius map.

If  $\sigma$  is a Frobenius map then  $\overline{G}_{\sigma} := \{g \in \overline{G} : \sigma(g) = g\}$  is a finite group.

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○○○
